Properly designed and made CAD solutions should be based on open standards, to maximize interoperability and reduce the effort required to support the same solution. The world is currently going through a CAD transition. With software as a service, or SAAS, rapidly becoming the norm in the CAD market, desktop CAD applications have been under siege for years. The traditional "on premise" model, with its heavyweight CAD software running on expensive and heavy computers, is becoming less and less popular, as business owners and decision makers are shifting their desktop CAD workload to the cloud. As a result, traditional desktop CAD systems are increasingly outdated, and also vulnerable to cyberattacks. A security review of Autodesk AutoCAD LT software for Windows operating systems (OS) indicates that the software is susceptible to several severe vulnerabilities, as well as significant network connectivity issues, such as the exposure of enterprise information, including network secrets and private keys. "As a leader in the design, engineering and construction industries, Autodesk is committed to developing the best-in-class software solutions to meet the unique needs of our customers and partners," said Doug Drexler, Autodesk director of product management. "We look forward to ensuring AutoCAD LT users are protected from exploitation of these identified vulnerabilities, by conducting timely updates and incorporating new security measures as the industry moves forward." Technical Details of the vulnerabilities Vulnerability Type: Application-Level Vulnerabilities Affected: The issues described below are specific to the version and build number of AutoCAD LT 2018 for Windows. A newer version of the software is not affected. See the section "Affected Software

Versions" below for more details. Vulnerability Description: An attacker can exploit the vulnerabilities in the legacy binary component ("binary") of the editor to gain access to the C:\ProgramData folder. If an attacker can exploit this vulnerability, an attacker could potentially modify the registry, launch programs or delete data. In the context of a software update, the vulnerabilities can cause a denial of service (preventing legitimate users from launching the software), or potentially reveal enterprise information, including network secrets and private keys. Vulnerabilities Acknowledgement: Autodesk has made reasonable efforts to ensure the vulnerability has been addressed and is not exploitable by unauthorized persons. No fixes are available. Severity Level: Critical Severity Description

The risk of rebleeding in patients with portal hypertension is increased by portal hypertension-related diseases (e.g., variceal and nonvariceal portal hypertensive bleeding, ascites, or hepatic encephalopathy) or by concomitant injuries (e.g., trauma). The frequency and underlying mechanisms of rebleeding in portal hypertensive patients have not been well established. We evaluated the frequency and mechanisms of portal vein and systemic rebleeding in an animal model of portal hypertension. In a rat model of portal hypertension, we performed two endoscopic variceal hemorrhage procedures (A, sham; B, portal vein ligation [PVL]). Bleeding was graded using an established grading scale. Rebleeding was defined as the reappearance of hemorrhage after initial cessation of bleeding. Rebleeding was evaluated at 1, 2, and 3 days after surgery. Liver tissue was collected and stained for hemostatic, inflammatory, and angiogenic medi 5b5f913d15
