AutoCAD R14 and Windows version history. From 2013, new major version releases are numbered with Arabic numerals and hence require replacing the previous version. To be released for the first time, the predecessor of AutoCAD was called Microstation, and was marketed by the now defunct Autodesk in 1983. The first version for the Macintosh was released in 1987 and was followed by Windows versions in 1988. With the release of AutoCAD 2000 for the Mac in 1995 and a Windows version in 1996, the numbering system was changed to base the version number on the year in which the software version is released. AutoCAD is a Microsoft Windows software application produced by Autodesk. It was the first cross-platform CAD application for the Windows platform. AutoCAD features include 2D/3D CAD, documentation, engineering, and architectural design tools. Versions of AutoCAD span 17 years and include four releases. AutoCAD first debuted in December 1982. The first version, AutoCAD 1.0, was developed for the Apple II and available for $5,000 (). AutoCAD 1.0 is a proprietary, binary-only design program that was later ported to DOS and other platforms. It includes features such as 2D/3D drawing, physics modeling and design, architectural design, and documentation tools. The first revision of AutoCAD, released in January 1983, was AutoCAD 1.1 and was released for the Apple II only (). The initial retail price for AutoCAD 1.1 was $17,500 (). It was the first cross-platform CAD application. A month later, the Macintosh version was released. Later versions of AutoCAD followed, with the first full-fledged version released in 1988 for DOS/PC-DOS, Windows 3.x, and Macintosh. Autodesk first released AutoCAD for the Mac in 1995 with AutoCAD 2000 for the Mac (). The AutoCAD version for Windows was released in 1996, with Autodesk revising it in 2000 with AutoCAD 2000 for Windows (). The 2000 version included features such as DWG compatibility, support for 2D/3D models, and included native support for Microsoft Windows 98, Windows 2000, and Windows NT. Autodesk then began releasing major version releases of AutoCAD for each year, with version numbers that are expressed in Arabic numerals. Thus, AutoCAD 2013 includes major new features, such as

Inputs A drawing may be imported by drag and drop, by copying an external DXF or DWG file, or by using one of the methods described below. Once imported into the drawing, it is ready for editing. Importing a drawing by dragging the file into the drawing window The dragged file is opened by the Import Drawing Wizard, which guides the user through the process of importing the file. Importing a drawing by using "File->Open" A file can be opened directly in the drawing by opening a dialog box, or by selecting the file to open it from the file open dialog box. Importing a drawing from the cloud The drawing can be imported from the cloud from a URL by opening a browser, opening an application such as Internet Explorer or Netscape Navigator, and typing the URL into the address bar. Managing drawings Drawings can be managed by viewing their properties and inserting objects. Once an object is inserted, properties of that object can be edited, and it can be linked to others. Objects and properties Objects can be inserted into a drawing by using the Insert menu or by dragging and dropping them from the library. Objects are linked to properties, or aspects of objects. For example, the length of a line may be automatically displayed as "Length." If the length is modified, the property will display the new value. Relations Objects can be related to each other.

Objects may be related by a property, or a set of objects may be related to a single object. For example, a wall object may be related to objects that represent walls and floors. Modeling objects Models may be created or edited. They include: a model can be cut to display a portion of it the endpoints of the model can be extruded and a hole can be created in the middle of the object a 3D solid can be created from multiple 2D lines a 3D surface can be created from multiple 2D planes a wireframe model can be created from a geometry model A model may also include a selection, which can be manipulated by the user. A selection can be cleared by selecting the "Clear Selection" option from the Selection menu. A model may be scaled. A model may be rotated. The model can be translated. The model can be mirrored and resized. The model can be zoomed. All these options a1d647c40b

Evaluation of a novel algorithm for registration of PET data to MR images for quantitative mapping of cerebral blood flow. The objective of this study was to evaluate a novel registration algorithm for PET data to MR images, focusing on the accuracy of cerebral blood flow (CBF) values. Eighteen healthy volunteers were scanned with PET and MRI. Three sets of parametric images were calculated (static, short echo time (ST), and spatially resolved arterial input (SRAIN) images) and corresponding CBF maps were calculated using the standard to standard and two novel registration algorithms. Both novel algorithms had similar efficacy as for the standard. In addition, absolute CBF values were calculated for each algorithm and compared with absolute CBF values calculated using the standard. For the novel algorithms, the voxel-based maximum CBF values in the gray matter (GM) were similar, but the absolute values calculated for the voxel-based CBF values in the white matter (WM) were somewhat higher and less stable than the standard algorithm. The novel algorithms seem to be as effective as the standard algorithm, and can be recommended as viable alternatives for use in clinical studies.Primary ovarian cancer: changes in trends and outcomes. To evaluate the trends and outcome of primary ovarian cancer patients (POC) in a tertiary care centre. A retrospective cohort study. The data of POC patients admitted to the Department of Obstetrics and Gynecology in the years 2004-2013 was analysed. Data was retrieved from the hospital database. The clinical and pathological data was extracted from the medical records. Postoperative mortality was assessed at 1 month and at 1 year. A total of 326 POC patients were included. The mean age was 49.8 ± 13.2 years. Most of the patients presented with advanced stage disease (FIGO III/IV in 91.7%). The mean tumour size was 4.8 cm (range, 2-20). The most common histological subtype was epithelial (62.8%). The postoperative mortality rate was 6.6% at 1 month and 10.5% at 1 year. The postoperative mortality rate was higher in the subgroup of patients with the FIGO stages I and II (p = 0.007). Among the
