You can create headers for table columns, you can insert Rows and Cols, and you can create table templates. You can also create tables directly within your drawing and save them as templates for future use. If you have not used tables yet, be sure to read this post. You can also create lists in AutoCAD. Lists can have variable length, and you can easily change their order, such as alphabetizing or reverse alphabetizing. Use the Master View The Master View provides an overview of all the drawing windows and the overall view of the drawing. You can access the Master View from the Home tab of the Ribbon, by clicking on the square master view button. You can use the Magnifier to zoom in and out on any selected portion of the drawing. You can also add 2D or 3D axes to your drawing for measuring distances and angles. You can add planar constraints in 2D and 3D drawing spaces. 3D (3D)G The intent of 3D Objects (3D) was to introduce 3D support into AutoCAD Activation Code R14, Release 14. This project was aimed to bring AutoCAD Serial Key into the 3D world. Support for 3D Objects is built into AutoCAD and can be accessed through the command line. 3D objects can be defined in the drawing file or in a separate file. They can be converted from 2D to 3D, or be directly imported into a drawing file. 3D objects can be placed in the drawing and display in 3D. AutoCAD can display an orthographic, isometric, or perspective view. File format: 3D files use a proprietary, binary format called 3DIG, developed by Autodesk. 3D files contain points, lines, planes, curved surfaces, solids, and meshes. Most objects are defined as a collection of points (points, lines, etc.) or curves and surfaces (faces, surfaces, etc.), and solids are built from collections of points and surfaces (generating a mesh). 3D files do not contain basic geometric primitives like circles or rectangles. 3D in AutoCAD is object-oriented. These objects have properties. Geometric properties of a 3D object are determined by the geometric properties of the objects and surfaces that make up the 3D object. Properties can be set at the time the object is defined, or later when it is saved in a drawing file. Objects in 3D are created, updated, and saved. Saving a 3D object is similar to that of a 2D object. 3D objects can be linked to specific AutoCAD objects, such as lines or circles, or linked to the entire drawing file. Objects can also be linked to other 3D objects. 3D and DXF objects are linked when 3D objects are placed into a drawing file. The "3D Object" command on the "Insert" menu is used to link to existing objects in the drawing file. If the linked 3D object is deleted or modified, the linked drawing objects will be updated automatically. 3D objects are dynamic; that is, you can alter the properties of a 3D object in the drawing, and it will reflect the change. 3D objects in a drawing can be displayed in a variety of ways. Common options are: Orthographic (a flat) view where objects are shown in a 1d647c40b
