Soviet Souls is a platformer in which you have to choose the right combat technique. The most important thing in combat is reflexes. So better to practice with a controller. Soviet Souls will keep you on your toes because the rules of the genre are different: there are invisible barriers, obstacles and waves that you have to avoid. The game was also reviewed on GECK by a user named Yuval Yuval wrote, "5.00/10 Average It's like a puzzle game made on the same theme. As I said, puzzles mostly based on invisible barriers and the player should find a way to go around them."The present invention relates to semiconductor device manufacturing technology, and more particularly, to a method of forming a contact hole in an integrated circuit. As the integration of the semiconductor devices increases, the area occupied by circuit elements becomes decreased and the size of contact holes for connecting elements to each other is also decreased, for example, to less than 0.5. $\mu$ m. But, the alignment of the contact hole during the process of etching the contact hole is difficult when the size of the contact hole is decreased. For example, if the size of a contact hole is 0.5. $\mu$ m, the width of a light shield layer for alignment may become equal to or less than 0.5. $\mu$ m. FIGS. 1A through 1D illustrate sequential cross-sectional views showing a conventional method of forming a contact hole. Referring to FIG. 1A, a field oxide layer 12 is formed in a predetermined portion of a semiconductor substrate 11. A polysilicon layer 14 serving as a gate oxide layer is deposited on the field oxide layer 12, and a gate 14a is then formed on the polysilicon layer 14. An ion implantation process is carried out to form a source/drain region 16 in the substrate 11 on both sides of the gate 14a. Referring to FIG. 1B, an inter-layer dielectric (ILD) layer 18 is deposited on the substrate 11 and then planarized, and a contact hole 18a is formed in the ILD layer 18, exposing a part of the source/drain region 16. Referring to FIG. 1C, a polysilicon layer 19 is deposited on the ILD layer 18 and then planarized, and a mask pattern 19a for the contact hole 18a is formed. A self-aligned contact (SAC) et
